Summary

Senior software engineer specializing in Python, Django, and microservices architecture. Demonstrated success in optimizing processes and managing complex integration projects, achieving substantial cost reductions and improved production efficiency.

Skills

- Django development
- Backend development
- API integration
- Microservices design
- Database management
- Query optimization
- Production debugging
- Monitoring systems
- Code review
- Problem solving

Experience

Senior Software Engineer Ridecell India Pvt. Ltd.

02/2020 to Current
Pune, IN

- Led end-to-end integration of vehicle hardware into Ridecell's fleet management platform, from API specification and backend implementation to mobile/frontend integration and production delivery.
- Designed and built a self-hosted hardware backend microservice to replace a third-party integration, **eliminating significant recurring costs** and providing greater control and flexibility over the hardware stack; migrated **thousands of production vehicles with zero downtime** and no disruption to live fleet operations.
- Safely decommissioned a **discontinued third-party hardware integration and its associated server infrastructure**, eliminating obsolete components while ensuring no impact to active production systems.
- Renamed and restructured hardware integration Django applications **without downtime**, improving code organisation and maintainability while ensuring uninterrupted production operations.
- Improved logging and observability across Go-based microservices, making production debugging and issue investigation faster and more effective for engineering teams.
- Identified and implemented a workaround for a third-party integration bug that caused charging events for **hundreds of users to be missed**, recovering lost charges and **saving thousands of dollars**.
- Implemented push notifications across **iOS and Android** for key stages of the carsharing rental journey, improving user visibility and communication throughout the rental lifecycle.
- Installed vehicle hardware on a real vehicle in Pune and conducted a live end-to-end production demonstration, validating integration across hardware, backend services, and platform functionality.
- Led multiple **proof-of-concepts (PoCs)**, conducted code reviews, and mentored junior engineers to improve code quality and accelerate technical onboarding.
- Refactored legacy code and redesigned application structures to **reduce technical debt**, improve maintainability, and establish cleaner engineering patterns.
- Automated the monthly **PCR branch-cut process** with a custom script, reducing manual effort and making release preparation more consistent and reliable.
- Developed a CSV-based capability to upload and provision vehicle data to **infleet vehicles**, streamlining hardware fleet management and operational workflows.

Open Source Contributions

- Weblate | Python · Django
 - Contributed to the Weblate open-source project by identifying and fixing bugs, and improving platform behavior.
 - Submitted 2 pull requests, including improvements to third-party translation integrations and support for additional translation configuration options.

Education and Training

PG Diploma: Advanced Computing

CDAC, Panchwati

02/2020

Pune

Bachelor of Technology: Electronics & Communication Engineering

University Institute of Engineering & Technology

06/2019

Kanpur

Awards & Honors

- The Rock Award — Ridecell: Recognized for exemplary commitment and ownership after installing vehicle hardware in a real car and successfully demonstrating the complete end-to-end integration, from hardware and backend services to the Ridecell platform.
